

A photograph of a family celebrating a birthday. An elderly man in a blue checkered shirt is leaning over a white birthday cake with blue polka dots. A young girl with blonde hair is looking at the cake with an open mouth. In the background, a woman and a man are smiling and clapping.

**Don't be in the
dark about AMD.**

Get tested today!

Age-related macular degeneration (AMD) is the leading cause of adult vision loss in the US. Fortunately, being testing with an AdaptDx Pro[®] device can help prevent vision loss by detecting AMD at least 3 years earlier.

WHAT IS AMD?

AMD is a disease that causes a part of your retina, called the macula, to slowly deteriorate as you get older. The macula is responsible for your central vision and allows you to do things like read, watch TV, recognize faces and drive.

As AMD progresses, symptoms may include distortion of straight lines or dark and blurry central vision. Testing with an AdaptDx Pro device helps your doctor find the disease before this happens.

NORMAL VISION

VISION WITH AMD

ARE YOU AT RISK OF DEVELOPING AMD?

One of the earliest symptoms of AMD is poor or failing night vision. In addition, there are several factors that may increase your risk, including:

- Age 50 or older
- Being overweight
- Family history of AMD
- Heart disease, high blood pressure or high cholesterol
- Caucasian (white)
- Smoker or past smoker

SHOULD YOU BE TESTED?

If you are having trouble seeing or driving at night, or have any of the risk factors, screening with an AdaptDx Pro device will likely be advised.

HOW DOES THE TEST WORK?

The AdaptDx Pro tests your ability to adapt from bright light to darkness. The test is simple and painless to take. Better yet, it provides a straightforward, objective score to help your doctor know if you have AMD so that measures can be implemented to prevent vision loss.
